

Chikungunya transmission and population susceptibility in Ceará, Brazil

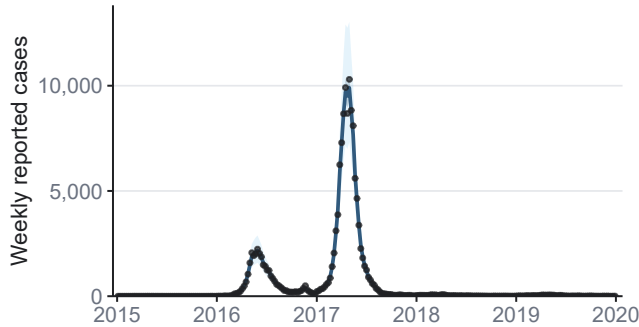

Bayesian renewal model v2.1, weekly observations from 2015 to 2019

A

Reported cases and posterior prediction

Shading: 95% predictive interval; dark band: 50% CrI

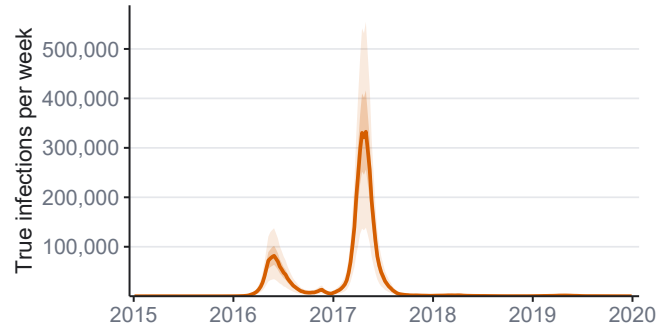

— Model expectation • Observed cases

B

Latent infection incidence

Median, 50% and 95% credible intervals

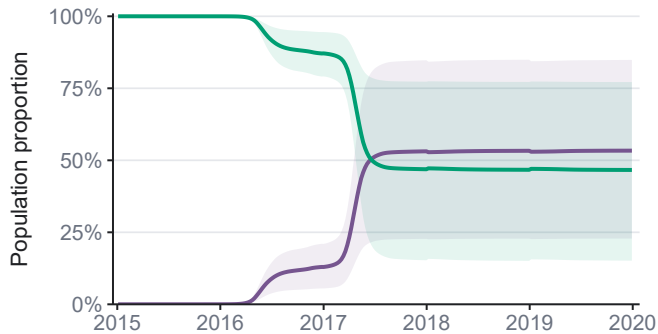

C

Population susceptibility and immunity

Weekly observed population; lifelong immunity

— Infection-derived immune — Susceptible

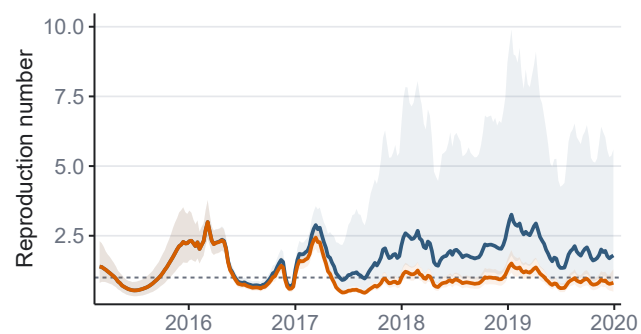

D

Time-varying reproduction numbers

$$R_{\text{eff}}(t) = R_0(t) \times S(t-1) / N(t-1)$$

— $R_0(t)$ — $R_{\text{eff}}(t)$

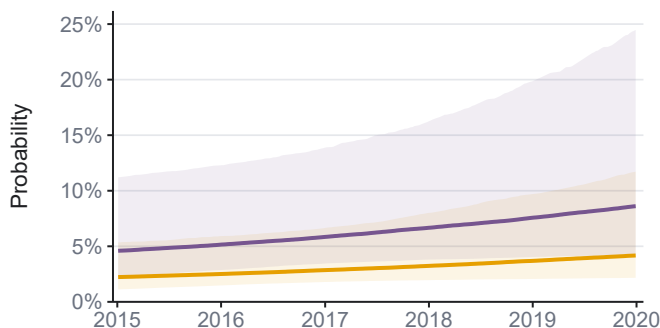

E

Case ascertainment

Estimated symptomatic proportion: 0.50 [0.37, 0.62]

— Infection-to-report — Symptomatic-case reporting

F

Cumulative infection and serological anchors

Shaded fields: Juazeiro do Norte (orange) and Quixadá (teal)

— Ceara — Site model — Site observed
