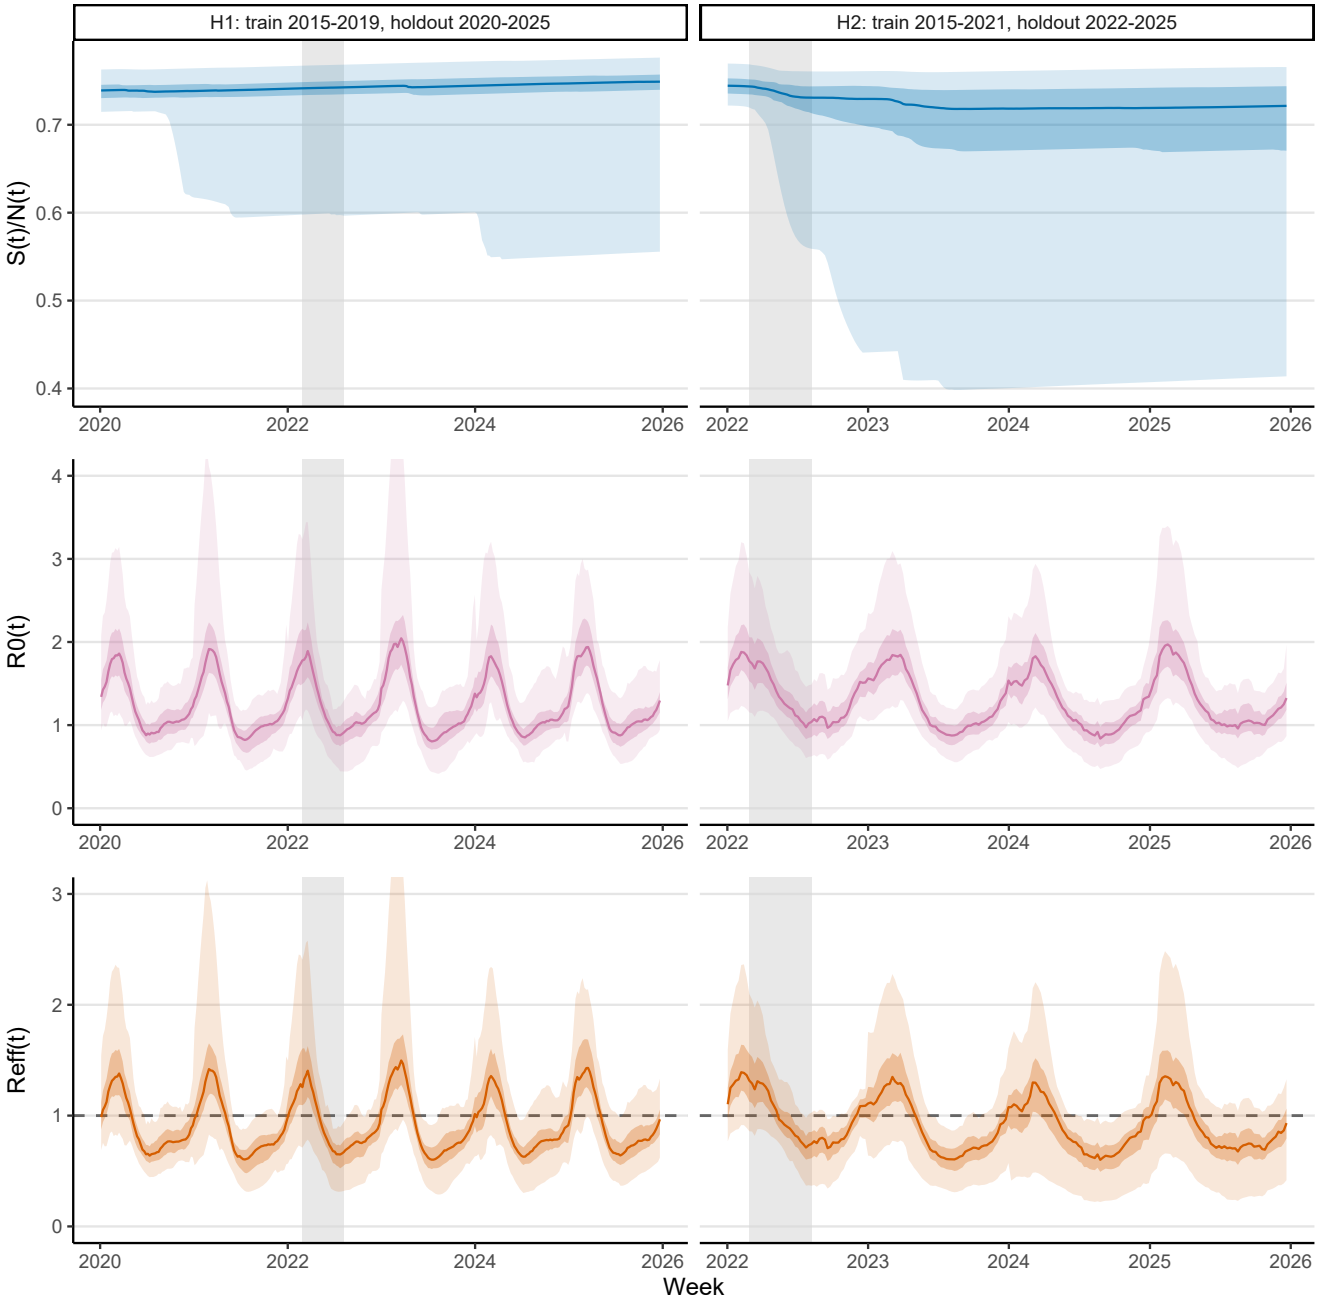

FIG21. Susceptibility and transmission diagnostics (G2, estimated tau_year)

Grey band = observed central-90% 2022 epidemic period (2022-02-27 to 2022-08-07).
Ribbons: 50%/95% across posterior draws x stochastic replicates.

PROVISIONAL: H1/H2 have low but nonzero divergences and incomplete mixing; tau_year upper-tail reliability is not fully established.
Training-derived quantities (posterior draws) are distinguished from stochastic holdout simulations (replicate-level trajectories) and from observed validation data (never used to fit/calibrate the holdout).
