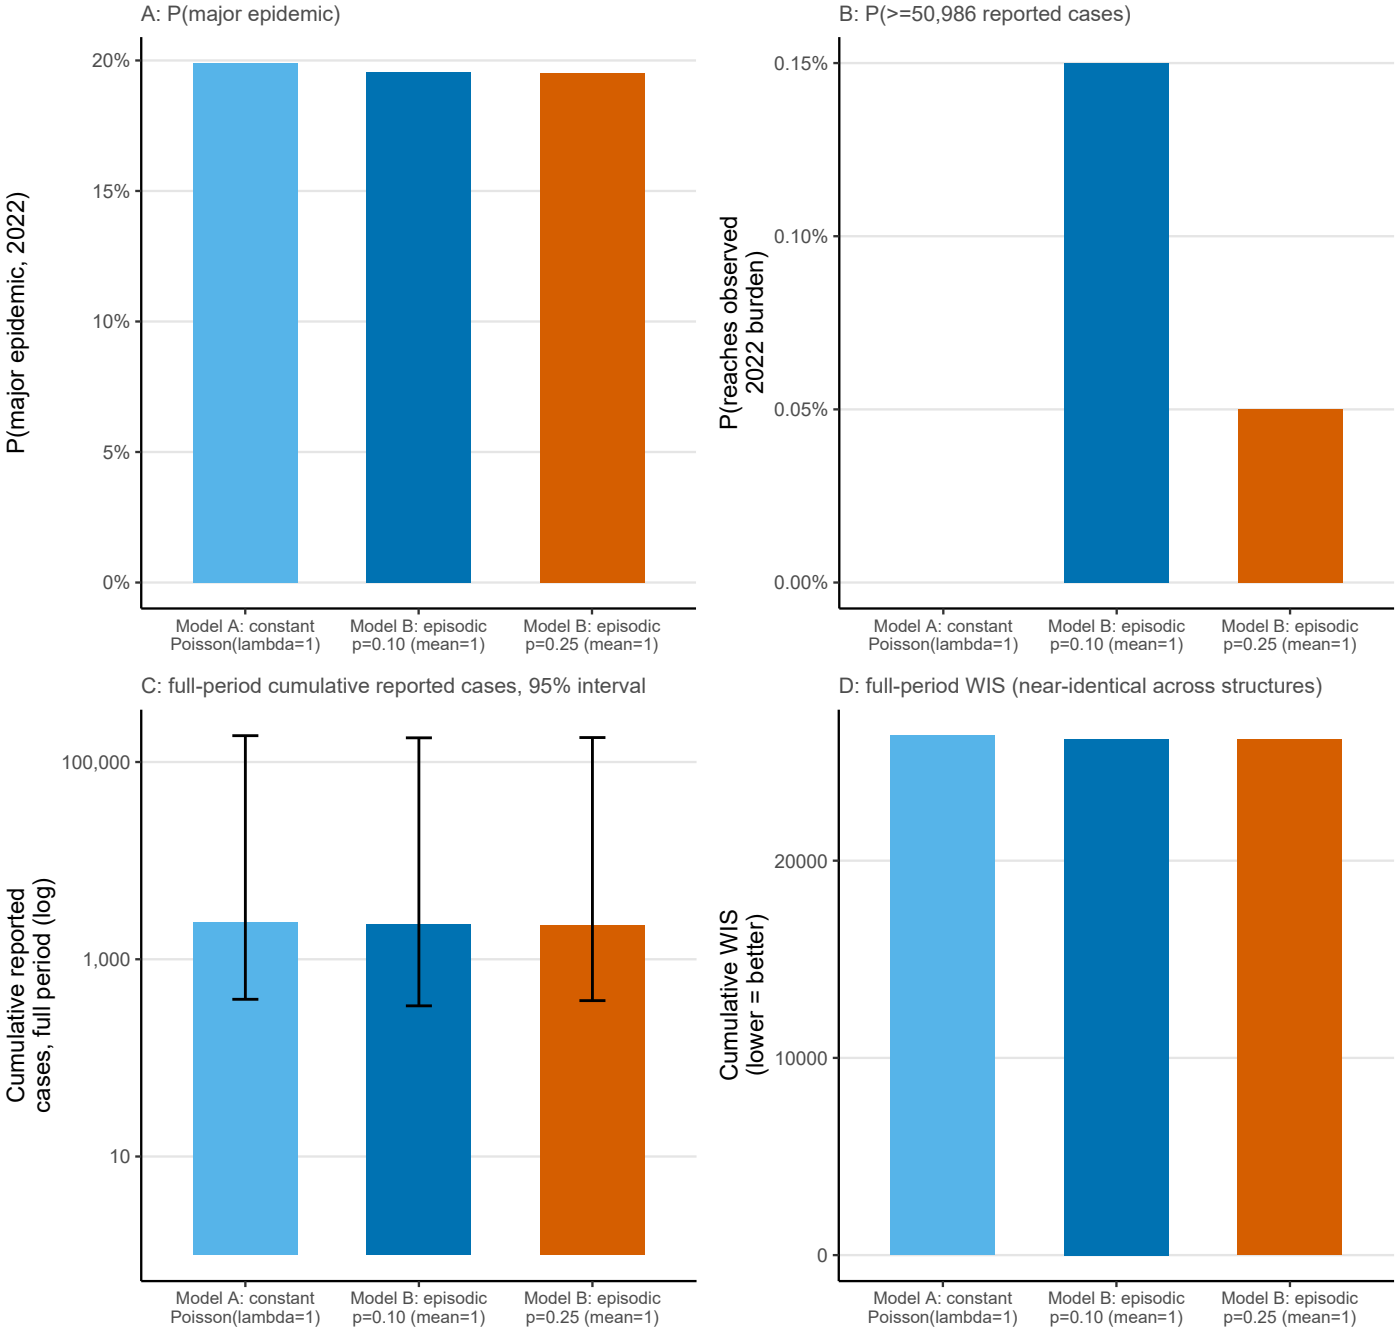
FIG_S75_3. Local amplification, entry-2022 infectiousness, and epidemic outcomes

At equal mean introduction pressure, structure (constant vs. episodic burst) changes outcomes only marginally -- magnitude, not clustering, is the binding constraint.



PROVISIONAL: H1/H2 have low but nonzero divergences and incomplete mixing; tau_year upper-tail reliability is not fully established. Diagnostic structural arms (p=0.10/0.25 prespecified, NOT fit); no lambda or process is chosen as a new reference.
