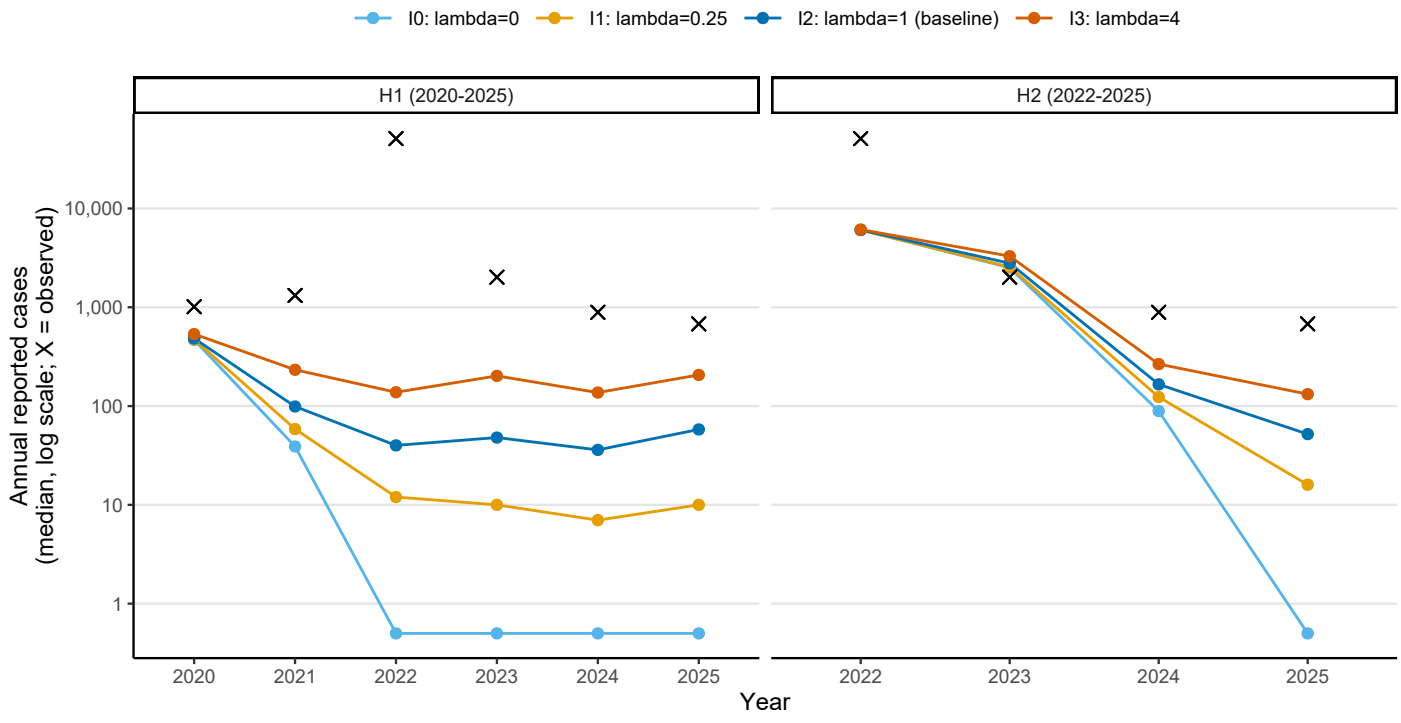

FIG27. Predictive-performance sensitivity across the importation grid

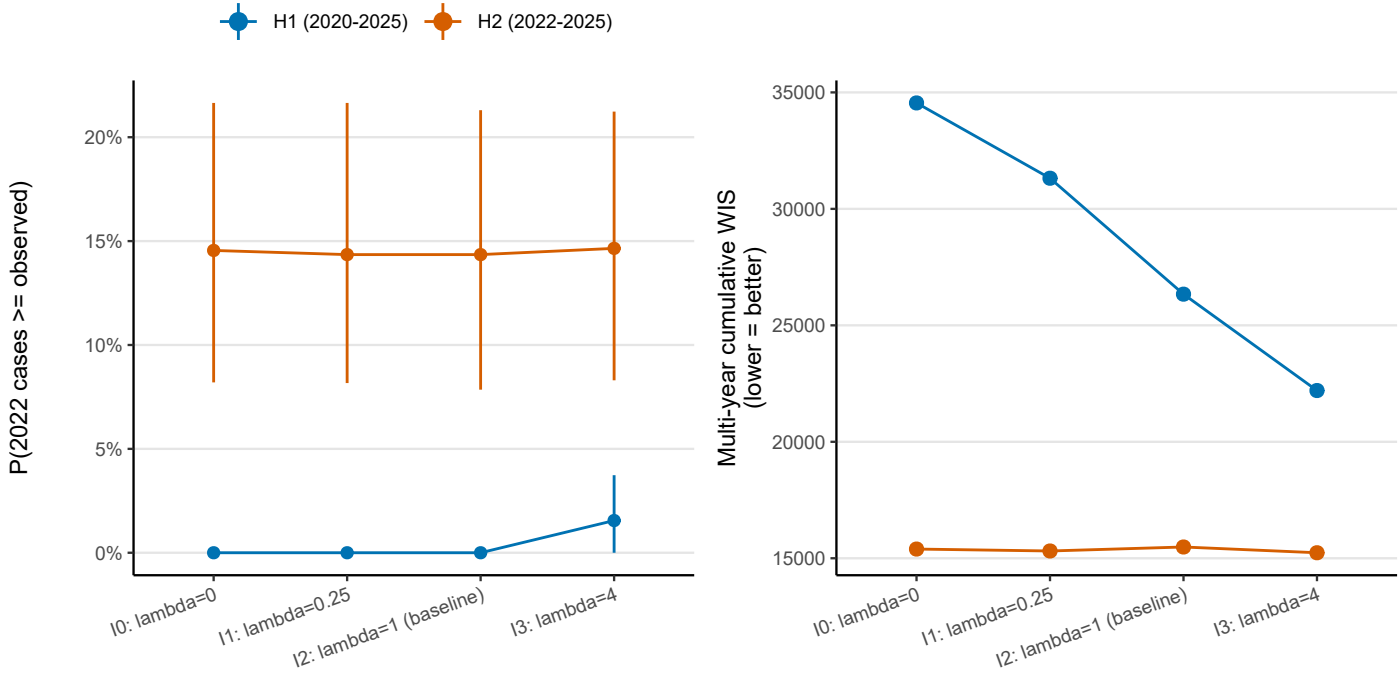

H1's WIS improves with higher lambda (panel C) but its 2022 exceedance probability stays near zero except at lambda=4 (panel B); H2 is comparatively insensitive to holdout-period lambda throughout.

A: annual predictive medians across the importation grid vs. observed (black X).

B: 2022 exceedance probability
(cluster-bootstrap 95% CI).

C: multi-year cumulative WIS
(proper scoring rule).

PROVISIONAL: H1/H2 training-only posteriors have low but nonzero HMC divergences and incomplete within-chain mixing (tau_year upper tail); all results below are conditional on this. Sensitivity ARMS (diagnostic, prespecified lambda grid), not calibrated model selection -- no lambda is chosen as a new reference.
